Result Sheet

Assignment: Standard Test
Student: Vanya Tanwar
Total Score: 17.5/32

Question	Score	Reason
1	0/1	Incorrect option chosen. The correct answer is B (2.16 cm).
2	1/1	Correct answer B (4.4 cm) selected with correct application of Thales' Theorem in rough work.
3	1/1	Correct answer D (50°) selected.
4	1/1	Correct answer B (4 : 7) selected.
5	0/1	Incorrect option selected. The correct answer is D ($DC^2 = CF \cdot AC$).
6	1/1	Correct answer C (x = 16, y = 8) selected.
7	0/1	Incorrect option selected. The correct option is D.
8	1/1	Correct answer A selected.
9	2/2	Fully correct proof establishing $\Delta ABD \sim \Delta CBA$ using AA similarity and obtaining $AB^2 = BC \times BD$ via corresponding sides ratio.
10	2.5/3	Correctly used the ratio AO/OC = AB/CD to find DC = 8 cm, but the formal proof of similarity between ΔAOB and ΔCOD was incomplete.
11	3/3	Accurate construction and application of the converse of midpoint theorem in triangles ΔADG and ΔBCF to prove AF = (1/3)AC.
12	1/5	Awarded 1 mark for stating Given, To Prove, and the ratios of segments. The rest of the proof using the diagonal and converse of BPT was not completed.
13	3.5/5	Correctly set up the similarity of ΔABD and ΔCAD by SAS. However, deducted 1.5 marks because the corresponding angle equality was stated incorrectly (confusing angle bisector properties with similarity relations).
14.i	0/1	Incorrect method and value. Did not use trigonometric ratios in right ΔCHB.
14.ii	0.5/1	Arrived at the correct answer AG = 38 m, but used an incorrect similarity proportion instead of trigonometry (tan 45° in right ΔAGF).
14.iii	0/2	Incomplete and incorrect attempt for finding perimeter of ΔABC.
14.iv	0/2	Not attempted.
