Result Sheet

Assignment: Standard Test
Student: Navagya Kaur
Total Score: 19.5/32

Question	Score	Reason
1	1/1	Correctly applied $\Delta APQ \sim \Delta ABC$ to find PQ = 2.16 cm (Option B).
2	1/1	Correctly applied Thales' theorem to determine AC = 4.4 cm (Option B).
3	1/1	Correctly determined corresponding angle $\angle P = 50°$ (Option D).
4	1/1	Correctly identified the ratio of perimeters as 4 : 7 (Option B).
5	1/1	Correctly selected option D ($DC^2 = CF \cdot AC$).
6	1/1	Correctly derived and selected option C (x = 16, y = 8).
7	0/1	Incorrect option chosen. Assertion is false since DE || BC, so the correct option is D.
8	1/1	Correctly selected option A (Both A and R are true and R is the correct explanation of A).
9	2/2	Correctly proved $\Delta ABC \sim \Delta ABD$ using AA criterion and deduced $AB^2 = BC \times BD$.
10	1/3	Identified similarity of vertically opposite triangles, but incorrectly set up the side ratio as 2/3 instead of 1/2, leading to an incorrect result of DC = 6 cm instead of 8 cm.
11	3/3	Complete and accurate proof using construction and the converse of the Midpoint Theorem to show AF = (1/3)AC.
12	1/5	Awarded 1 mark for attempting trisection ratios and diagonal construction. Deducted 4 marks because the proof relies on invalid assumptions (treating collinear angles as vertically opposite angles and assuming parallelism by construction rather than using converse of BPT).
13	5/5	Excellent and rigorous proof using SAS similarity of ΔADC and ΔADB to deduce $\angle BAC = 90°$.
14.i	0/1	Incorrect method and values used; failed to use trigonometry with the 45° angle in ΔCHB to find BC.
14.ii	0/1	Incorrect method; failed to use tan 45° in right ΔAGF to find AG = 38 m.
14.iii	0/2	Question was not attempted.
14.iv	0.5/2	Awarded 0.5 marks for the method of summing the segments (AF + FE + EB). Deducted 1.5 marks for calculating EB incorrectly using assumed coordinates instead of trigonometry (cos 30°).
